

# Proportional pressure reducing valves type DHRZO

direct operated, ISO 4401 size 06

DHRZO are 3 way, proportional pressure reducing valves, direct operated, with standard ISO 4401 size 06 mounting surface

### Technical characteristics

They provide the pressure reduction on ports A, or B or A and B, depending on the valve model. The direct execution performs low internal leakages, fast response and low hysteresis.

The valves are available in different executions:

proportional solenoids with separated (-A) or integral (-AEB/-AES) digital electronics

### Typical applications

Pressure reduction in low flow systems  
Pilot stage for proportional valves DPZO-A\*

Mounting surface: ISO 4401, size 06

Max flow: 24 l/min

Max pressure: 315 bar

Max regulated pressure: 25 bar

### 3 GENERAL NOTES

DHRZO-A\* proportional valves are CE marked according to the applicable Directives (e.g. Immunity/Emission EMC Directive and Low Voltage Directive).

Installation, wirings and start-up procedures must be performed according to the general prescriptions shown in table F003 and in the installation notes supplied with relevant components.

### 4 FIELDBUS - only for AES

Fieldbus allows the direct communication of the proportional valve with machine control unit for digital reference signal, diagnostics and settings of functional parameters. Analog reference signal remain available on the main connector for quick commissioning and maintenance. For detailed information about fieldbus features and specification see tech table **GS510**.

**8 OPTIONS for -A**

**8.1 Coil voltage**

- Option /6** optional coil to be used with Atos drivers with power supply 12 Vdc
- Option /18** optional coil to be used with electronic drivers not supplied by Atos

**9 ELECTRONIC OPTIONS - for AEB and AES**

Standard driver execution provides on the 7 pin main connector:

**Power supply** - 24Vdc must be appropriately stabilized or rectified and filtered; a 2,5 A fuse time lag is required in series to each driver power supply. Apply at least a 10000 µF/40 V capacitance to single phase rectifiers or a 4700 µF/40 V capacitance to three phase rectifiers

**Reference input signal** - analog differential input with 0÷+10 Vdc nominal range (pin D,E), proportional to desired valve pressure regulation

**Monitor output signal** - analog output signal proportional to the actual valve's coil current (1V monitor = 1A coil current)

**Note:** a minimum booting time of 500 ms has been considered from the driver energizing with the 24 Vdc power supply before the valve has been ready to operate. During this time the current to the valve coils is switched to zero.

**9.1 Option /I**

It provides 4 ÷ 20 mA current reference signal, instead of the standard 0÷+10 Vdc.

Input signal can be reconfigured via software selecting between voltage and current, within a maximum range of ±10 V or ±20 mA.

It is normally used in case of long distance between the machine control unit and the valve or where the reference signal can be affected by electrical noise; the valve functioning is disabled in case of reference signal cable breakage

**9.2 Option /Q**

To enable the driver, supply 24 Vdc on pin C referred to pin B: Enable input signal allows to enable/disable the current supply to the solenoid, without removing the electrical power supply to the driver; it is used to maintain active the communication and the other driver functions when the valve has to be disabled. This condition does not comply with European Norms EN13849-1 (ex EN954-1).

**9.3 Option /Z**

It provides, on the 12 pin main connector, the following additional features:

**Enable Input Signal**

To enable the driver, supply 24 Vdc on pin 3 referred to pin 2: Enable input signal allows to enable/disable the current supply to the solenoid, without removing the electrical power supply to the driver; it is used to maintain active the communication and the other driver functions when the valve has to be disabled. This condition does not comply with European Norms EN13849-1 (ex EN954-1).

**Fault Output Signal**

Fault output signal indicates fault conditions of the driver (solenoid short circuits/not connected, reference signal cable broken for 4÷20mA input, etc.). Fault presence corresponds to 0 Vdc, normal working corresponds to 24 Vdc (pin 11 referred to pin 2): Fault status is not affected by the Enable input signal

**Power supply for driver's logics and communication**

Separate power supply (pin 9,10) allow to cut solenoid power supply (pin 1,2) while maintaining active diagnostics, serial and fieldbus communication. A safety fuse is required in series to each driver power supply: 500 mA fast fuse

**9.4 Possible combined options: /I,Q, /Z**

## 10 ELECTRONIC CONNECTIONS

### 10.1 Main connector signals - 7 pin - standard and /Q option - DHRZO-AEB and DHRZO-AES (A1)
